

Document Title: NEOM Green Hydrogen Production Project

NEOM Green Hydrogen Company (NGHC) was established in 2020 as an equal joint venture between three key partners: ACWA Power, Air Products, and NEOM. The facility is located in the Oxagon industrial zone within NEOM, in northwestern Saudi Arabia. The project aims to operate the world's largest commercial facility for producing completely carbon-free green hydrogen using renewable energy by 2026. The total investment cost is approximately US\$8.4 billion; about US\$6.1 billion of this was funded through non-recourse loans and credit facilities provided by 23 international and local banks and financial institutions.

The plant utilizes approximately 4 gigawatts of renewable energy—sourced from both solar and wind power—to operate water electrolysis units supplied by Thyssenkrupp Nucera, with a capacity exceeding 2 gigawatts. The facility is expected to produce up to 600 metric tonnes of green hydrogen daily, which will be entirely converted into approximately 1.2 million tonnes of green ammonia annually to facilitate transport and export. Under a 30-year exclusive off-take agreement, Air Products will purchase 100% of the green ammonia output for distribution in global markets, focusing on the heavy-duty transport and heavy industry sectors to reduce carbon dioxide emissions by approximately 5 million tonnes annually.
